

YONO

Don't Train Your Agents, Embed Them

Automating Execution with [Context](#)

Problem

Massive investments in interface agents are not delivering ROI

Deployments fail due to hallucinated actions and code drift

Time to Market

Building actionable agents requires months of custom engineering.

Reliability

60% of enterprise agents fail. They lack product context and hallucinate actions.

Maintenance Drain

Drift management and evaluations consume up to 40% of engineering resources.

Solution

Auto-generating structured context directly from the front-end codebase

Engine: We ingest a GitHub repository, map the internal workflows, and output a ready-to-use data layer.

Velocity

Deploy actionable agents in hours, not months.

Grounded Execution

Provide reliable product context so agents can execute actions bound to the product truth.

Zero Maintenance

Auto-sync directly with the codebase to bypass the enterprise IT bottleneck entirely.

Why Now?

The enterprise market is abandoning fragile chatbots for high-ROI, agentic infrastructure

Yesterday (2023-25)

Fragile Experiments

Investors poured billions into fragile Chatbots and Copilots.

*Reality: High churn.
Models commoditized.
Agents hallucinated
without business context.*

Today (2026)

Context Gap

a16z confirms LLMs are generic reasoning engines that require a dedicated context layer.

60% GenAI projects abandoned due to lack of trust. (Gartner)

Tomorrow (2026+)

Agentic Dominance

Enterprise spending on autonomous agents surpasses chatbots by 2027.

Agentic interfaces yield 49% ROI. Market hits \$753B by 2030.

Traction

Validation from the field

Secured pipeline gated by SOC2 & 90-day product milestones

Competition

The market is split between chat wrappers and API orchestrators

Yono bypasses both by automating context directly from the front-end.

Category	Example	Limitation	Yono Fix
Conversational Front-Ends	Sierra, Wonderful	High OpEx. Requires armies of humans to manually script conversation flows.	Automated Setup. Structurally map frontend codebase to learn the flows instantly.
Backend Integration	Adapt	Connects via backend APIs, requiring lengthy integration cycles.	Zero-Touch. Natively parse UI state to bypass backend API bottlenecks.
Internal Build	DIY	Drift management takes 40%+ of enterprise engineering resources.	Self-Healing. Auto-syncs with codebase to eliminate maintenance drain.

Foundation: YONO — A reliable processing engine that reverse-engineers the frontend into a live state graph.

Product & GTM Strategy

Capturing mid-market revenue immediately while hardening the architecture for \$100K+ enterprise deployments

INPUT

GitHub Repository and optional enrichment

PROCESS

Map entities, relationships, workflows, and user stories.

TECH

- Reverse Engineering
- Gen Testing Module
- Agent Platform

OUTPUT

Actionable Agents

Reliable, Self-Healing, and bound to live state.

Phase 1: Immediate Revenue

Overnight Actionable Agents

Target mid-market and hyper-growth scaleups to capture \$50K ACV. Harden the architecture and prove the rapid-deployment wedge.

Phase 2: Enterprise Scale

Live-Sync Release

Unlock the 'High-Velocity, High-ACV' Enterprise tier. Roll out on-prem modules to bypass final security blockers, capturing the \$150K legacy pipeline.

Team & Opportunity

Raising \$4.5M to scale MM revenue & accelerate ENT rollout

Daniel Roche (CEO)

Ex-monday.com

Scaled engine from \$380M to \$1.2B ARR

Daniel Blokh (CTO)

Ex-Unit 8200

2x CTO, LLM/Engine Architect
